Session Title
Up- and Down-scaling approaches in Polar Ecosystem Research

Session Description
A huge amount of single results on biological processes and ecologically relevant chemo-physical parameters have become available in the past decades. Overarching topical themes in ecosystem research demand results, which are representative for larger units of an assessment in terms of time, space and coverage of taxonomic, as well as functional, organism groups. Up-scaling research concepts, including modeling approaches, fitted sampling designs and analyses provide results, which fulfill these criteria. Notwithstanding, down-scaling approaches are needed to get better insights into the mechanisms of functioning of ecological systems including their drivers and provide a means to parameterize processes for models. This can be achieved through detailed analyses of comparative data and surveys as well as in situ experiments in areas identified by large-scaled surveys, e.g. hot and cold spots or representative scenarios in biological processes and biodiversity. We welcome contributions to ecosystem research in the Arctic or Antarctic (or both), which focus on biological processes and the use of different environmental parameters, illustrating of up-scaling or down-scaling approaches and how they help us understand the functioning of polar ecosystems.

Keywords: System understanding, small-large scale analyses, in situ experiments, biological processes, Terrestrial, Marine, Arctic, Antarctic

Lead Convener: Jose Xavier
Email: jccx@cantab.net
Affiliation lead-convener: Marine and Environmental Sciences Centre, University of Coimbra Portugal and British Antarctic Survey, NERC, Cambridge, United Kingdom

Co-convener 1: Heike Link
Email: link.heike@uni-rostock.de
Affiliation: University of Rostock, Germany

Co-convener 2: Oscar Schofield
Email: oscar@marine.rutgers.edu
Affiliation: Rutgers University, USA

Co-convener 3: Francyne Elias-Piera
Email: francyne.ep@gmail.com
Affiliation: Korea Polar Research Institute, South Korea
